

SMSPool API: Order, View and Cancel Numbers

[SMSPool Admin](#) May 31, 2026

You will need an SMSPool account with a balance and a valid API key. You can find your API key on our [How to use the SMSPool API](#) page .

All requests to the SMSPool API use HTTPS POST with form data. There is no SDK required. Any HTTP client works, whether that is Python Requests, PHP's cURL, JavaScript's Fetch, or a tool like Postman.

Your API key is passed with every request. Keep it private. Do not expose it in client-side code or public repositories to prevent unauthorised access to your account.

How to Order a Number via the API

Send a POST request to the order endpoint with your selected country and service. SMSPool returns a phone number and an order ID you will use to track and cancel the order.

Endpoint:

POST <https://api.smspool.net/purchase/sms>

Required parameters:

Parameter	Description
key	Your API key
country	Country in ISO format or numeric ID from the Country List endpoint
service	Service name or numeric ID from the Service List endpoint

Optional parameters:

Parameter	Description
pool	Pool ID from the Pool List endpoint (defaults to auto)
max_price	Maximum price you are willing to pay per number
pricing_option	0 for cheapest available, 1 for highest success rate
quantity	Number of rentals to order at once
areacode	Area codes to include or exclude, passed as JSON
exclude	Set to 1 to exclude all listed area codes
activation_type	SMS (default), VOICE, or FLASH
create_token	Set to 1 to generate a shareable token link for the number
carrier	1 or 2 - The carrier feature only works on pool Foxtrot US numbers

Example request (Python):

```
import requests
```

```
data = {
    "key": "YOUR_API_KEY",
    "country": "US",
    "service": "Discord"
}

response = requests.post("https://api.smspool.net/purchase/sms", data=data)
print(response.json())
```

Successful response:

```
{
    "success": 1,
    "number": 14155552671,
    "cc": "1",
    "phonenumber": "4155552671",
    "order_id": "ABCDEFGH",
    "country": "United States",
    "service": "Discord",
    "pool": 1,
    "expires_in": 1200,
    "expiration": 1705309968,
    "message": "You have succesfully ordered a discord number from pool: Foxtrot for 0.24.",
    "cost": "0.24",
    "cost_in_cents": 24
}
```

Save the `order_id`. You will need it to check for incoming codes and to cancel the order if needed.

Common failure responses:

Out of stock:

```
{
    "success": 0,
    "type": "OUT_OF_STOCK"
}
```

Insufficient balance:

```
{
    "success": 0,
    "type": "BALANCE_ERROR"
}
```

No pool found under your max price:

```
{
    "success": 0,
    "type": "PRICE_NOT_FOUND"
}
```

How to Check an Order and Retrieve SMS Codes

Once you have placed an order, poll the check endpoint to see if a code has arrived. SMSPool does not push notifications, so your application needs to poll on a schedule.

Endpoint:

POST <https://api.smspool.net/sms/check>

Required parameters:

Parameter	Description
key	Your API key
orderid	The order_id returned when you placed the order

Example request (Python):

```
import requests

data = {
    "key": "YOUR_API_KEY",
    "orderid": "ABCDEFGH"
}

response = requests.post("https://api.smspool.net/sms/check", data=data)
print(response.json())
```

The response uses a numeric `status` field rather than a success flag. Here are the values you need to handle:

Status	Meaning
1	Pending - no code yet
3	Complete - code received
6	Refunded

Response when pending:

```
{
  "status": 1,
  "resend": 0,
  "expiration": 1704562249,
  "time_left": 1173
}
```

Response when a code has arrived (status 3):

```
{
  "status": 3,
  "sms": "12345",
  "full_sms": "Full code: 12345",
  "expiration": 1704562249
}
```

Response when refunded (status 6):

```
{
  "status": 6,
  "message": "This order has been refunded",
  "resend": 0,
  "expiration": 1704562249,
  "time_left": 1134
}
```

`sms` contains the extracted code. `full_sms` contains the complete raw message. Use `time_left` (in seconds) to know when to stop polling.

A polling interval of 3 to 5 seconds is reasonable. Most codes arrive within 30 to 60 seconds.

How to View All Active Orders

You can retrieve all of your currently active orders in one request. This is useful for dashboards or any workflow where you are managing multiple numbers at once.

Endpoint:

POST <https://api.smspool.net/request/active>

Required parameters:

Parameter	Description
key	Your API key

Example request (Python):

```
import requests

data = {
    "key": "YOUR_API_KEY"
}

response = requests.post("https://api.smspool.net/request/active", data=data)
print(response.json())
```

Successful response:

```
[
  {
    "timestamp": "2024-01-06 18:03:15",
    "cost": "0.24",
    "order_code": "ABCDEFGH",
    "phonenumber": "1234567890",
    "code": "0",
    "full_code": "",
    "short_name": "US",
    "service": "discord",
    "status": "pending",
    "expiry": 1704561795,
    "time_left": 1126
  }
]
```

Note that active orders use `order_code` and `phonenumber`, not `order_id` and `number`. Use `time_left` (seconds) to track how long each rental has remaining.

How to Cancel an Order via the API

You can cancel an active order before it expires. Our system will automatically refund you if no code was received within the time period.

Endpoint:

POST <https://api.smspool.net/sms/cancel>

Required parameters:

Parameter	Description
key	Your API key
orderid	The <code>order_id</code> you want to cancel

Example request (Python):

```
import requests

data = {
    "key": "YOUR_API_KEY",
    "orderid": "ABCDEFGH"
}

response = requests.post("https://api.smspool.net/sms/cancel", data=data)
print(response.json())
```

Successful response:

```
{
  "success": 1,
  "message": "The order has been cancelled, and you have been refunded 0.24 dollars."
}
```

Order not found:

```
{
  "success": 0,
  "message": "We could not find this order!"
}
```

Too early to cancel (time-locked):

```
{
  "success": 0,
  "message": "Your order cannot be cancelled yet, please try again later."
}
```

There is a short window at the start of a rental during which cancellation is locked. If you get the "cannot be cancelled yet" response, wait a few seconds and retry. Once cancelled, the refund is instant.

Handling Errors

Always check the `success` field first. For the check endpoint, use the numeric `status` field instead.

Common issues:

Error	Cause
BALANCE_ERROR	Top up your account before ordering
OUT_OF_STOCK	No numbers available for that service and country combination
PRICE_NOT_FOUND	No pool available under your <code>max_price</code> limit
We could not find this order!	Wrong <code>order_id</code> or order has expired
cannot be cancelled yet	Cancellation is time-locked at the start of a rental - retry after a few seconds

HTTP 429 means you are hitting rate limits. Back off and retry later.

Building a Reliable Ordering Loop

For automating verification at volume, a solid ordering loop looks like this:

1. Check your account balance before ordering
2. Place the order, store the `order_id`
3. Poll the check endpoint every 3 to 5 seconds, handling status 1, 3, and 6
4. If status 3 arrives, extract the code from `sms` and proceed
5. If the rental expires without a code, cancel the order and retry with a new number
6. Log every `order_id` and outcome for debugging

Run multiple orders in parallel rather than sequentially when working at volume. Use the active orders endpoint to track everything at once.

FAQ

What can I do with the SMSPool API? The SMSPool API gives you programmatic access to all of our services, including temporary SMS verifications for hundreds of services and countries, long-term rental numbers, data-only eSIMs, carrier lookups, balance and order history checks, and workflow automation within your own applications or tools.

Do you have an SMS-Activate or Hero-SMS compatible API? Yes. You can use the SMS-Activate/Hero-SMS stub endpoint at https://api.smspool.net/stubs/handler_api. Supported parameters are `pool`, `maxPrice`, `action`, `country`, and `service`. By default you must use SMS-Activate/Hero-SMS service and country IDs. If you want to use SMSPool IDs instead, add `&setting=smspool` to your request.

How do I get my SMSPool API key? Log into your account and go to the API section of your dashboard. Keep it private and regenerate it if you think it has been compromised.

What happens if I do not cancel an order? You will be automatically refunded by our system if the code is not received within the time period.

Can I order numbers for multiple services at the same time? Yes. Each order is independent. You can have as many active orders as your balance supports provided that you are receiving SMS. Use the active orders endpoint to track all orders at once.

Can I remove rate-limits? Yes. You can remove order rate limits by applying for a [Business Account](#).

Why is my order returning OUT_OF_STOCK? The service and country combination you requested has no available numbers right now. Try a different country if the service supports it, or retry shortly.

How long do SMS rentals last? The `expires_in` field in the order response tells you the duration in seconds. `time_left` in the check and active orders responses tells you how many seconds remain from the current moment.

What is the difference between `sms` and `full_sms` in the check response? `sms` is the extracted verification code. `full_sms` is the complete raw message text. For most use cases `sms` is all you need, but `full_sms` is useful if the service includes extra context in the message.

Can I request a specific carrier? Yes, but only on pool Foxtrot for US numbers. Pass `carrier` as 1 or 2 in your order request.

What does `activation_type` do? It controls how the verification code is delivered. `SMS` receives a standard text message, `VOICE` receives a phone call that reads out the code, and `FLASH` is for flash calls

used by some verification flows. The Default is sms and this feature only works on the Mike pool at the moment.

Is there a rate limit on the API? Yes, the rate limit is 32 requests per second for normal accounts. Sending too many requests in a short window returns a 429 response (Also known as a rate-limit).

Can I use the API without a positive balance? No. You can authenticate and query informational endpoints without balance, but any order attempt will return a `BALANCE_ERROR`.

Why does my cancellation return "cannot be cancelled yet"? There is a short time-lock at the start of every rental. Wait a few seconds and try again. This is different from an order that cannot be cancelled because it is already complete or expired.

What programming languages can I use with the SMSPool API? Any language that can make HTTPS POST requests with form data. Python, PHP, JavaScript, Ruby, Go, and cURL all work without any special setup.

Ready to start building? [Get your API key from the SMSPool dashboard](#) and place your first order in minutes.
